

A. Temporal Shear Measurements

B. Detection Significance by System

C. Temporal Shear vs Source Redshift

D. Temporal Shear vs Geometric Factor

E. DESJ0408 A-D: Scale-Dependent Delay

F. Null Control Systems

COSMOGRAIL TEMPORAL SHEAR ANALYSIS: KEY FINDINGS

Main sample: 48 measurable image pairs; 0 pairs exceed 2σ in the current rerun.
 Best pair: DESJ0408 B-D with $|\Gamma|/\sigma = 1.6$.
 Null controls: HE0435 and WFI2033 remain consistent with $\Gamma = 0$.
 Injection-recovery: mean bias 0.29 days/decade (unbiased).
 Achromaticity: partial – primary systems remain single-band only.

Top constraints:

- DESJ0408 B-D: $\Gamma = +40.7 \pm 25.6$ (1.6σ)
- PG1115 A-C: $\Gamma = +29.0 \pm 18.8$ (1.5σ)
- DESJ0408 A-B: $\Gamma = -90.7 \pm 72.0$ (1.3σ)

Verdict: constraint/exploratory; current data bound temporal shear but do not yield a clean detection.
